

Individual reflection week 4

This week I haven't been able to get much done because I've been sick for most of the week. I was, however, able to participate in the sprint planning meeting at the start of the week.

Since I couldn't participate in designing the system model with UML diagrams, I instead stayed at home and learned more about android studio development by reading the documentation. This week I got more of an overview of the application structure, but I would like to get more hands-on experience with implementing these structures with code in the future. I can do this by trying it out on a test application, or learning more about it when we start development of the coffee application.

I didn't have any opportunity to help anyone else on the team this week, as I couldn't meet with any of my teammates apart from a single meeting.

My contribution to the team's use of scrum this week was my participation in planning this week's sprint, where we filled the product backlog and decided which user stories we were going to complete.

I wasn't able to contribute to the deliverables this week, as these consisted mainly of designing the system model, which we decided would be done by the entire group.
