

Individual reflection week 3

This week I refreshed my memory of the framework used in Android Studio for developing android apps. I also learned the importance of estimating user stories, as we had issues with unbalanced workloads. I would like to learn more about Android Studio so that I can create effective design models of the software we are going to develop, and I'm going to do this through reading documentation, watching Youtube videos and testing what I learn myself.

I have helped others learn new things by giving my own opinion on things I believe I have more understanding/knowledge of. I will continue being helpful in the future by doing this more, as well as helping anyone in need of help.

My contribution to the team's use of scrum has been participating in meetings and creating user stories for this week's sprint. I will continue contributing by doing this in the future as well, along with discussing any scrum problems we might have in our meetings.

I contributed to the team's deliverables this week by setting up our repo on github as an android project, as well as contributing to the initial mockup/design of our application in Figma. As this week has been a shorter sprint (we were late in deciding the project), I would like to contribute more in the future sprints. I can do this by helping create more user stories and then completing them.
