

Individual reflection week 7

This week I've learned more about Room, more specifically how to store more complex data types by storing json strings, and how to populate the database when it gets created. Next sprint I would like to learn more about how to make different parts of our application work together, as that is the last step necessary for us to have created a minimal viable product.

This week I've helped others by participating in meetings and giving my input, as well as communicating a few times over discord. I feel that the current dynamics in regards to communicating and helping others are working, so next sprint I will continue working in the same way.

My contribution to the team's use of scrum has been participating in meetings, where I helped estimate and create user stories and tasks for the sprint. I also gave my input in the retrospective of what I think works and doesn't.

This week I contributed to the team's deliverables by implementing the CoffeeProduct part of the database/model. I also worked on getting our 'open data' into the database when it gets created. A minimal viable product is almost finished, but a lot of different parts of our development process still needs to be combined into one program, so that's what I think we should focus on next week.
