

## Individual reflection week 8

This sprint I got a more detailed overview of how the parts of our application interact with each other. I didn't learn much more than that as this week was mostly spent on delivering a minimal shippable product.

This week I've helped others by just having open communication and with participation in meetings. I feel like this framework/way of helping others has worked well in this project, and will therefore continue using it in future projects.

I contributed to the team's use of scrum this week by participating in meetings and giving my input in regards to estimation, work distribution among other things. In this project I feel like we've successfully worked on the project in parallel (which is one of the benefits of agile), but I felt that the team's meetings were a little unstructured compared to what I imagine you do at a real company. I would therefore say that creating a clear structure for what to do in the meetings is something we could implement in future projects to improve our agile development process.

My contributions to the deliverables consisted mostly of bug fixing this week, and making sure everything works with each other, as this was the last sprint.
