Individual reflection week 2

What I have learned this week is how to divide user stories into individual tasks, and how to formulate user stories by vertical slices rather than horizontal ones. What I would like to learn more about is how specific one needs to be in regards to tasks. For example, should the tasks be as specific as to refer to individual functions, classes, packages or something else? How I plan on learning this is by formulating tasks I feel are sufficient, and then asking for a response from a tutor.

This week there hasn't been a sprint, so the only help I've given has been through meetings where the entire group has been involved. Therefore there is not much to reflect on, but my plan for having a good system of helping other people is simply to help when asked and help whenever I see someone who struggles with something I know more about.

As we haven't started nor practiced any scrum processes this week, there's not much to write on this point.

My contribution towards the team's deliverables has been to participate in team meetings and give input regarding the scope and subject of our project. Once again there's not much to write here as we haven't really started yet.
