Individual reflection week 1

After the first week of learning about agile and scrum I feel like I'm beginning to understand the general ideas behind these frameworks. What I feel like I'm missing is how a concrete implementation of these ideas would play out in reality. The practice run in Minetest was enlightening, but there are obviously a lot of differences compared to how we are going to do it in the project, such as the product owner not being part of the group, the length of each sprint etc. But I will probably start learning more about concrete implementation through experience once we start working on the project.

Helping others to learn new things is in my opinion best accomplished through open communication, such as correcting whenever I feel someone has misunderstood something (or getting corrected if it is myself who has misunderstood). Discussing the process often also ensures that everyone stays on the same page.

So far we haven't gained a lot of experience using scrum, but so far I feel like most of the team members sort of have the same role, which is coming up with ways to break a feature/user story into different tasks so that we can work in parallel and complete it quickly. Perhaps an improvement could be more clear cut roles in the team, which I could achieve by bringing it up in the next team meeting for discussion.

My contribution towards the deliveries has mostly been just completing tasks and helping the team come up with ways to help us work more effectively. I don't believe there's much more to write about deliveries this week as we have not started working on the project, and what we have done has just been practicing using the scrum framework.
