Individual reflection week 6

This week I spent a lot of time learning about android's standard architecture components as I worked on adapting our design model to use these components. I did however mostly focus on design, so next sprint I would like to focus more on implementation, which I can do by doing the implementation user stories.

This week I've helped a member of my team by reviewing his pull request and answering questions. In future sprints I plan on continuing helping my team whenever requested.

This week I contributed to the use of scrum by participating in the scrum meetings, at which I did things such as helping with planning the sprint, and giving my perspective in the retrospective. However this week during the planning, we took too much time which led to us growing tired by the end of it, which we believe led to some mistakes in our estimation. In the future we should make sure to plan our sprint more efficiently, so that we don't tire ourselves out like we did this week. I can contribute to this by making sure we're on track during the sprint planning.

I contributed to the team's deliverables this week by creating a complete redesign of our design model, as our previous one didn't make use of android's standard components. In the next sprint I would like to focus more on implementation, as I did none of it this week, which I can do by picking the appropriate user stories.
