Individual Reflection

I now need to look at how you successfully move data. There are containers that need to be filled with data from our model and we want to it as good as possible.
Since my own work consists of some different containers is it both good practice and crucial that I learn correctly. Some other parts of the project do use similar parts, so I have a great way to start thanks to my teammates.

If I get a better grip on my part can I possible use it as a template to show the rest of the group, specifically those who haven't worked with XML grids and adapters.
Also if I have some time over might I rework or refine the design of my part, so that we might have fewer questions for next meeting.

I have added User stories and helped writing tasks. Other than the usual have I kept the stakeholder updated and discussed a potential meeting time for the last review. Allowing us to have feedback on our project and see what we need to update or rework on our scrum board.

My user story might have been a little too big for 1 week. I didn't quite finish on Friday, but I knew giving Monday would it be done. We discussed our bad approximation and decided to keep it in mind when we do user stories.
Since I have the relationship with the stakeholder do I keep him updated. He isn't interested in the code part and puts most effort into seeing if we are on course and if we have misunderstood any of his instructions.
